# **Acronyms**

**BI** Business Intelligence

**DFM** Dimensional Fact Model

**DM** Data Mart

**DSS** Decision Support System

**DWH** Data Warehouse

**EIS** Executive Information System

**ERP** Enterprise Resource Planning

ETL Extraction, Transformation, Loading

MIS Management Information System

**OLAP** Online Analysical Processing

**OLTP** Online Transaction Processing

# 1 Introduction

### 1.1 Data

Data Collection of raw values.

Data

**Information** Organized data (e.g. relationships, context, ...).

Information

**Knowledge** Understanding information.

Knowledge

#### 1.1.1 Data sources

**Transaction** Business event that generates or modifies data in an information system (e.g. database).

Transaction

**Signal** Measure produced by a sensor.

Signal

### **External subjects**

# 1.1.2 Software

**Online Transaction Processing (OLTP)** Class of programs to support transaction oriented applications and data storage. Suitable for real-time applications.

Online Transaction Processing

**Enterprise Resource Planning (ERP)** Integrated system to manage all the processes of a business. Uses a shared database for all applications. Suitable for real-time applications.

Enterprise Resource Planning

# 1.1.3 Insight

Decision can be classified as:

**Structured** Established and well understood situations. What is needed is known.

Structured decision

**Unstructured** Unplanned and unclear situations. What is needed for the decision is unknown.

Unstructured decision

Different levels of insight can be extracted by:

**Management Information System (MIS)** Standardized reporting system built on existing OLTP. Used for structured decisions.

Management Information System

**Decision Support System (DSS)** Analytical system to provide support for unstructured decisions.

Decision Support System

**Executive Information System (EIS)** Formulate high level decisions that impact the organization.

Executive Information System

**Online Analysical Processing (OLAP)** Grouped analysis of multidimensional data. Involves large amount of data.

Online Analysical Processing **Business Intelligence (BI)** Applications, infrastructure, tools and best practices to analyze information.

Business Intelligence

**Big data** Large and/or complex and/or fast changing collection of data that traditional DBMSs are unable to process.

Big data

**Structured** e.g. relational tables.

Unstructured e.g. videos.

Semi-structured e.g. JSON.

**Anaylitics** Structured decision driven by data.

Anaylitics

Data mining

**Data mining** Discovery process for unstructured decisions.

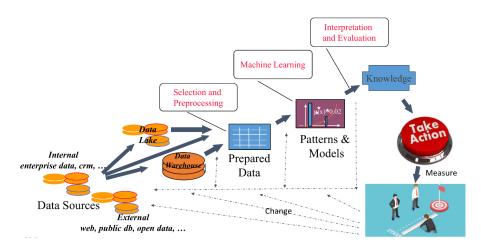

Figure 1.1: Data mining process

**Machine learning** Learning models and algorithms that allow to extract patterns from Machine learning data.

# 2 Business Intelligence

**Business Intelligence** Transform raw data into information. Deliver the right information to the right people at the right time through the right channel.

Business Intelligence

**Data Warehouse (DWH)** Optimized repository that stores information for decision making processes. DWHs are a specific type of DSS.

Data Warehouse

#### Features:

- Subject-oriented: focused on enterprise specific concepts.
- Integrates data from different sources and provides an unified view.
- Non-volatile storage with change tracking.

**Data Mart (DM)** Subset of the primary DWH with information relevant to a specific Data Mart business area.

# 2.1 Online Analysical Processing (OLAP)

**OLAP analyses** Able to interactively navigate the information in a data warehouse. Allows to visualize different levels of aggregation.

Online Analysical Processing (OLAP)

**OLAP session** Navigation path created by the operations that a user applied.

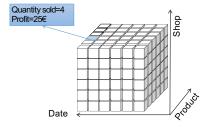

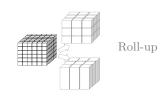

Figure 2.1: OLAP data cube

#### 2.1.1 Operators

 $\label{eq:Roll-up} \textbf{Roll-up} \begin{tabular}{ll} \textbf{Increases the level of aggregation (i.e. $\tt GROUP BY in SQL)}. Some \\ \textbf{details are collapsed together.} \end{tabular}$ 

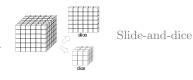

**Drill-down** Reduces the level of aggregation. Some details are reintroduced.

The slice operator reduces the number of dimensions (i.e. drops columns).

Slide-and-dice

The dice operator reduces the number of data being analyzed (i.e. LIMIT in SQL).

Changes the layout of the data, to analyze it from a different viewpoint.

**Drill-across** Links concepts from different data sources (i.e. JOIN in SQL).

**Drill-through** Switches from multidimensional aggregated data to operational data (e.g. Drill-through a spreadsheet).

# 2.2 Extraction, Transformation, Loading (ETL)

The ETL process extracts, integrates and cleans operational data that will be loaded into a data warehouse.

Extraction, Transformation, Loading (ETL)

#### 2.2.1 Extraction

Extracted operational data can be:

**Structured** with a predefined data model (e.g. relational DB, CSV)

Strucured data

**Untructured** without a predefined data model (e.g. social media content)

Unstrucured data

Extraction can be of two types:

**Static** The entirety of the operational data are extracted to populate the data warehouse for the first time.

Static extraction

**Incremental** Only changes applied since the last extraction are considered. Can be based on a timestamp or a trigger.

Incremental extraction

### 2.2.2 Cleaning

Operational data may contain:

**Duplicate data** 

Missing data

Improper use of fields (e.g. saving the phone number in the notes field)

Wrong values (e.g. 30th of February)

**Inconsistency** (e.g. use of different abbreviations)

#### **Typos**

Methods to clean and increase the quality of the data are:

**Dictionary-based techniques** Lookup tables to substitute abbreviations, synonyms or typos. Applicable if the domain is known and limited.

Dictionary-based cleaning

**Approximate merging** Merging data that do not have a common key.

Approximate merging

**Approximate join** Use non-key attributes to join two tables (e.g. using the name and surname instead of an unique identifier).

**Similarity approach** Use similarity functions (e.g. edit distance) to merge multiple instances of the same information (e.g. typo in customer surname).

Ad-hoc algorithms

Ad-hoc algorithms

#### 2.2.3 Transformation

Data are transformed to respect the format of the data warehouse:

**Conversion** Modifications of types and formats (e.g. date format)

Conversion

**Enrichment** Creating new information by using existing attributes (e.g. compute profit from receipts and expenses)

Enrichment

**Separation and concatenation** Denormalization of the data: introduces redundances (i.e. breaks normal form<sup>1</sup>) to speed up operations.

Separation and concatenation

# 2.2.4 Loading

Adding data into a data warehouse:

**Refresh** The entire DWH is rewritten.

Refresh loading

**Update** Only the changes are added to the DWH. Old data are not modified.

Update loading

### 2.3 Data warehouse architectures

The architecture of a data warehouse should meet the following requirements:

**Separation** Separate the analytical and transactional workflows.

**Scalability** Hardware and software should be easily upgradable.

**Extensibility** Capability to host new applications and technologies without the need to redesign the system.

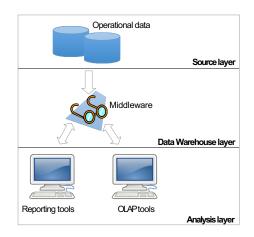

**Security** Access control.

Administrability Easily manageable.

<sup>1</sup>https://en.wikipedia.org/wiki/Database\_normalization

# 2.3.1 Single-layer architecture

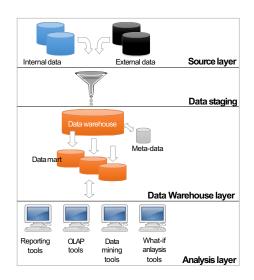

- Minimizes the amount of data stored (i.e. no redundances).
- The source layer is the only physical layer (i.e. no separation).
- A middleware provides the DWH features.

Single-layer architecture

# 2.3.2 Two-layer architecture

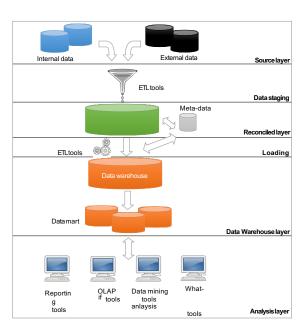

- Source data (source layer) are physically separated from the DWH (data warehouse layer).
- A staging layer applies ETL procedures before populating the DWH.
- The DWH is a centralized repository from which data marts can be created. Metadata repositories store information on sources, staging and data marts schematics.

Two-layer architecture

# 2.3.3 Three-layer architecture

• A reconciled layer enhances the cleaned data coming from the staging step by adding enterprise-level details (i.e. adds more redundancy before populating the DWH).

Three-layer architecture

# 2.4 Conceptual modeling

**Dimensional Fact Model (DFM)** Conceptual model to support the design of data marts. The main concepts are:

Dimensional Fact Model (DFM)

Fact Concept relevant to decision-making processes (e.g. sales).

**Measure** Numerical property to describe a fact (e.g. profit).

**Dimension** Property of a fact with a finite domain (e.g. date).

**Dimensional attribute** Property of a dimension (e.g. month).

**Hierarchy** A tree where the root is a dimension and nodes are dimensional attributes (e.g. date  $\rightarrow$  month).

**Primary event** Occurrence of a fact. It is described by a tuple with a value for each dimension and each measure.

**Secondary event** Aggregation of primary events. Measures of primary events are aggregated if they have the same (preselected) dimensional attributes.

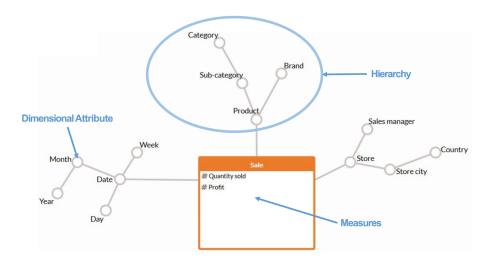

Figure 2.2: Example of DFM

| Primar        | y events      |                       |    |        |      |   |        |     |
|---------------|---------------|-----------------------|----|--------|------|---|--------|-----|
| Date          | Store         | Product               |    | Qty so | old  |   | Profit |     |
| 01/03/15      | Central store | e Milk                |    |        | 20   |   | 6      | 0   |
| 01/03/15      | Central store | e Coke                |    |        | 25   |   | 5      | 0   |
| 02/03/15      | Central store | e Bread               |    |        | 40   |   | 7      | 0   |
| 10/03/15      | Central store | e Wine                |    |        | 15   |   | 15     | 0   |
| Second        | dary event    |                       | SL | JM ,   | ,    | S | UM ,   |     |
| Month         | Store         | Category              |    | Qty    | sold |   | Profi  | it  |
| March<br>2015 | Central store | Food and<br>Beverages |    |        | 10   | 0 |        | 330 |

Figure 2.3: Example of primary and secondary events

# 2.4.1 Aggregation operators

Measures can be classified as:

Flow measures Flow measures Evaluated cumulatively with respect to a time interval (e.g. quantity sold).

Level measures **Level measures** Evaluated at a particular time (e.g. number of products in inventory).

Unit measures **Unit measures** Evaluated at a particular time but expressed in relative terms (e.g. unit price).

Aggregation operators can be classified as:

**Distributive** Able to calculate aggregates from partial aggregates (e.g. SUM, MIN, MAX).

**Algebraic** Requires a finite number of support measures to compute the result (e.g. AVG).

**Holistic** Requires an infinite number of support measures to compute the result (e.g. Holistic operators RANK).

Distributive operators

Algebraic operators

Additive measure **Additivity** A measure is additive along a dimension if an aggregation operator can be

| applied.      |                      |                          |
|---------------|----------------------|--------------------------|
|               | Temporal hierarchies | Non-temporal hierarchies |
| Flow measures | SUM, AVG, MIN, MAX   | SUM, AVG, MIN, MAX       |

SUM, AVG, MIN, MAX

AVG, MIN, MAX

Table 2.1: Allowed operators for each measure type

AVG, MIN, MAX

AVG, MIN, MAX

# 2.4.2 Logical design

Level measures

Unit measures

Defining the data structures (e.g. tables and relationships) according to a conceptual Logical design model. There are mainly two strategies:

Star schema Star schema A fact table that contains all the measures and linked to dimensional tables.

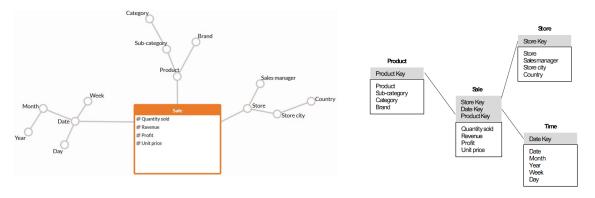

Figure 2.4: Example of star schema

Snowflake schema **Snowflake schema** A star schema variant with partially normalized dimension tables.

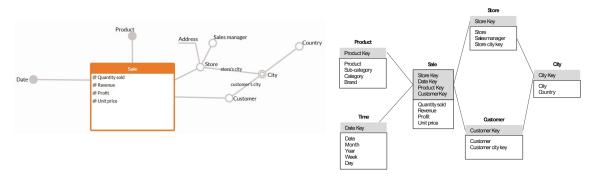

Figure 2.5: Example of snowflake schema
